

std::exception

```
classDiagram
    class std_exception["std::exception"]
    class ebi_util_curl_URLRetrievalException["ebi::util::curl::URLRetrievalException"]
    ebi_util_curl_URLRetrievalException --|> std_exception
```

The diagram illustrates a C++ inheritance relationship. At the top is a class box for `std::exception`, which is divided into three horizontal sections: the top section contains the class name, and the two bottom sections are empty. Below it is a class box for `ebi::util::curl::URLRetrievalException`, which is divided into three horizontal sections. The top section contains the class name, the middle section is empty, and the bottom section contains two public member functions: `+ URLRetrievalException()` and `+ what()`. A blue arrow with an open triangular head points from the top of the `ebi::util::curl::URLRetrievalException` box to the bottom of the `std::exception` box, indicating that `ebi::util::curl::URLRetrievalException` inherits from `std::exception`.

ebi::util::curl::URLRetrieval
Exception

+ URLRetrievalException()
+ what()
